# Part 1

## Introduction

### 1.1 Document Purpose

The purpose of this document is to outline the project requirements. That is, what the project is to accomplish once all of the requirements outlined in this document have been completed and to what standard they shall be considered done. The benefits of meeting these requirements and solving this problem will be. This document will then identify the constraints that these requirements impose on this project will be.

### 1.2 Background

Both in the consumer and professional sectors the use of autonomous aerial vehicles is growing quickly.

Use the references here

Background is going to be a long section and maybe we should have subsections...

### 1.3 Aim

The aim of this project is to build an air robot that is able to identify a target and move to the target, effectively avoiding any obstacles that are in the way. Maybe add a benefit or relation to the problem from background?

### 1.4 Scope

The scope of the project is limited due to only testing indoors. This limits the range at which we can set up targets from the robot for identification, and it constraints certain characteristics of the obstacles. To fit everything inside for testing we will be using smaller obstacles. (I don't know what else he wants, it says clearly state what you will do but isn't that the aim??). A possible end goal of this project is...

## Part 2

# Requirement Definition Activities

### 2.1 Information

#### 2.1.1 Meetings with Dr. Givigi

### 2.2 How References Were Used

#### 2.2.1 First Reference

Don't forget most references will be used in the background part.

#### 2.2.2 Another Reference

## Part 3

# Product Requirements

### 3.1 Functional Requirements (FR)

#### 3.1.1 FR-01: State Machine

Create a state machine for both land and air robots that allows for a movement decision to be made based on an input from the robot.

#### 3.1.2 FR-02: Movement Toward Target

The air and land robots will be able to move toward a target under control.

#### 3.1.3 FR-03: Trajectory Library

Create a trajectory library that will contain all possible allowed movements for both the land and air robots.

#### 3.1.4 FR-04: Trajectory Library Updating State Machine

The Trajectory Library will update the state machine when a movement was made. The state machine will then account for this displacement and later correct the movement to keep the robot on the path to the target.

#### 3.1.5 FR-05: Identification of Target

The robot shall recognize optically a goal and be able to give information on the targets location relative to the robot.

#### 3.1.6 FR-06: Avoiding Obstacle

The robot shall be able to make a deviation from its current movement pattern to avoid an obstacle in its path and then return to this pattern.

#### 3.1.7 FR-07: Identification of Obstacle

The robot shall recognize optically obstacles in its environment and identify where they are relative to itself.

### **3.1.8 FR-is 08: Multiple Obstacles**

The robot shall be able identify multiple obstacles and determine which is the most dangerous and avoid it accordingly.

## **3.2 Performance Requirements (PR)**

### **3.2.1 PR-01: Target Identification**

The robot will be able to identify and locate OpenCV's ArCuo shapes within a 15m radius. See FR-05.

### **3.2.2 PR-02: State Machine Corrections**

The state machine will be able to correct for movements made and put the robot back on its original path without deviating more than 15cm (we need to pick a acceptable deviation). See FR-04.

## **3.3 Interface Requirements (IR)**

### **3.3.1 IR-01: Turtlebot Communication through ROS**

Communication to the Turtlebot will be done through Robot Operating System through USB.

### **3.3.2 IR-02: Air Robot Communication**

The air robot will be communicating through Robot Operating System over wireless network.

## **3.4 Simulation Requirements (SimR)**

### **3.4.1 SimR-01: Air Robot**

The final product will be an air robot, but for simulation we will be using a TurtleBot to create and test our systems.

## **3.5 Implementation Requirements (ImpR)**

### **3.5.1 ImpR-01: Turtlebot Robot Operating System**

The simplest obstacle avoidance algorithm must be implemented on a Turtlebot using the Robot Operating System.

## **3.6 Schedule Restrictions (SR)**

### **3.6.1 SchR-01: First Prototype**

The first functional prototype shall be available for Beta testing no later than November 1<sup>st</sup>. (Still thats super soon to have a fully functioning Turtlebot)

## Part 4

# Risk Assessment

4.1 Risks

4.2 Likelihood

4.3 Impact

## Part 5

# Conclusion

### 5.1 Summary
